

Building Foundations in NestJS

Getting Started with Your First NestJS Project

NestJS Assignment 1

Objective

In this assignment, you will set up your NestJS environment, build your first project, and create a custom controller to understand the core architecture of NestJS. By the end of this task, you should be able to bootstrap a NestJS app, understand how modules, controllers, and services work, and implement and test a new route.

Task Requirements

Setup & Installation

1. **Install Node.js (LTS):** Ensure you have Node.js installed on your system. You can download it from the Node.js official website.
2. **Install Nest CLI:** Open your terminal and run the following command to install the Nest CLI globally:
3. `npm i -g @nestjs/cli`
4. **Install VS Code + Recommended Extensions:**
 - Download and install Visual Studio Code.
 - Install the following extensions: ESLint, Prettier, and NestJS Files for better code management and formatting.

Project Initialization

1. **Create a Project:** Initialize a new NestJS project by running:
2. `nest new nest-practice`
3. Follow the prompts to complete the setup.
4. **Explore Default Files:** Open the project in VS Code and familiarize yourself with the default file structure.

Run the Application

1. **Start the App:** In your terminal, navigate to your project directory and start the application with:

2. `npm run start:dev`
3. **Confirm Default Route:** Open your browser and go to `http://localhost:3000` to ensure it returns "Hello World".

Deliverables

1. **Screenshot 1:** Capture a screenshot of the `/` route showing "Hello World".
2. **Screenshot 2:** Create a new route `/hello` that returns "Hello from HelloController!" and capture a screenshot of this route.

Evaluation Criteria

- **Correct environment setup & successful project run:** Ensure your environment is correctly set up and the project runs without errors.
- **Working `/hello` endpoint returning expected output:** Implement the `/hello` endpoint to return the specified message.
- **Clean, formatted code (follow NestJS style guidelines):** Ensure your code adheres to NestJS style guidelines, using tools like ESLint and Prettier.
- **Clear explanation of controller responsibilities:** Provide a concise and clear explanation of the role of controllers in NestJS.

Submission Guidelines

1. **Name the Main File:** Ensure your main HTML file is named `index.html`.
2. **Push Project to GitHub:** Upload your project to a GitHub repository.
3. **Deploy Using Netlify:** Deploy your application using Netlify. Refer to online resources or videos if needed.
4. **Submit:** Provide the Netlify deploy link (and GitHub repo link if requested).
